Elimination

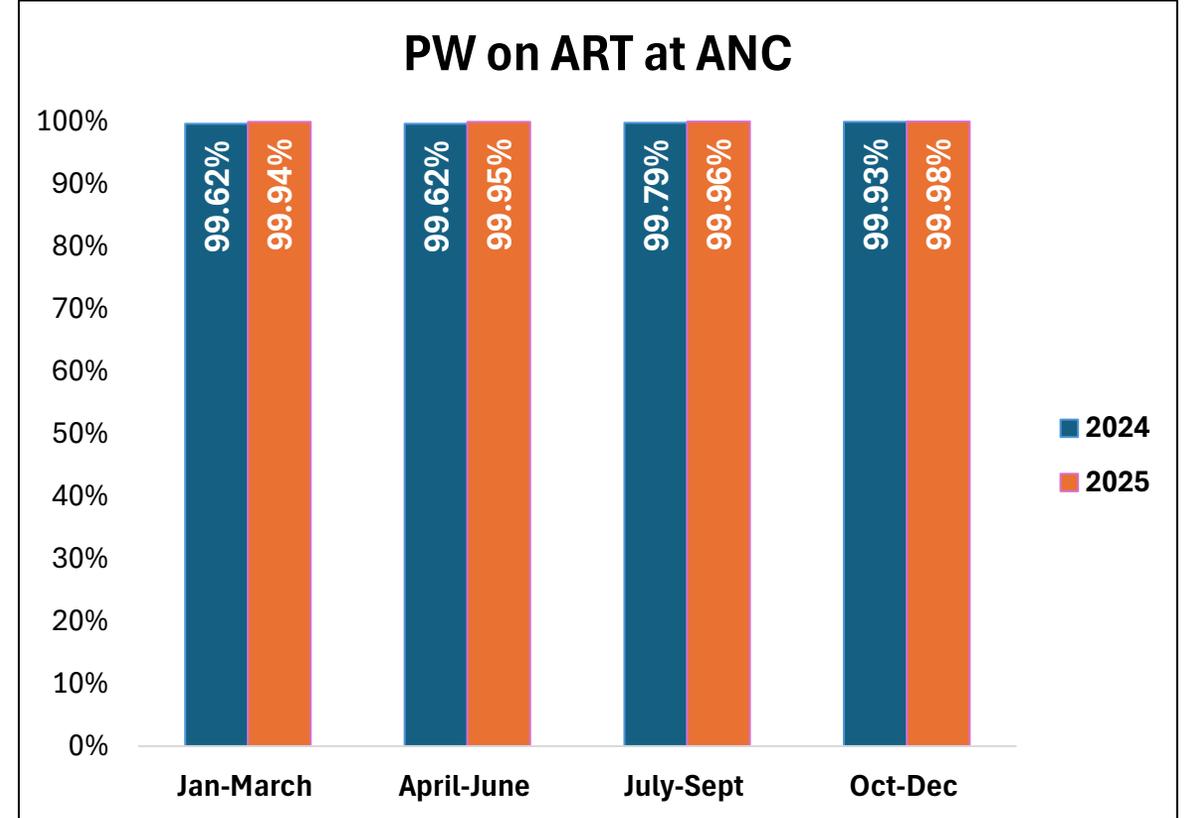

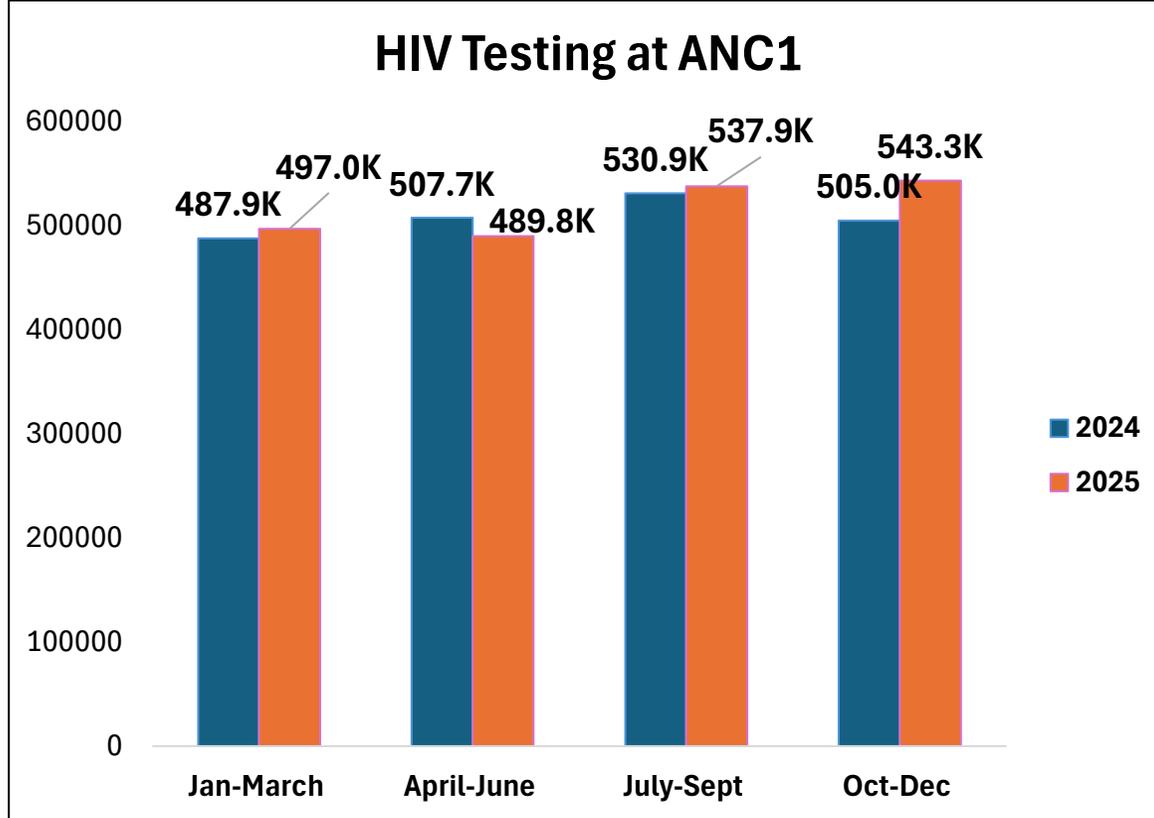

Performance of the VTP Cascade 2025: Infant Testing

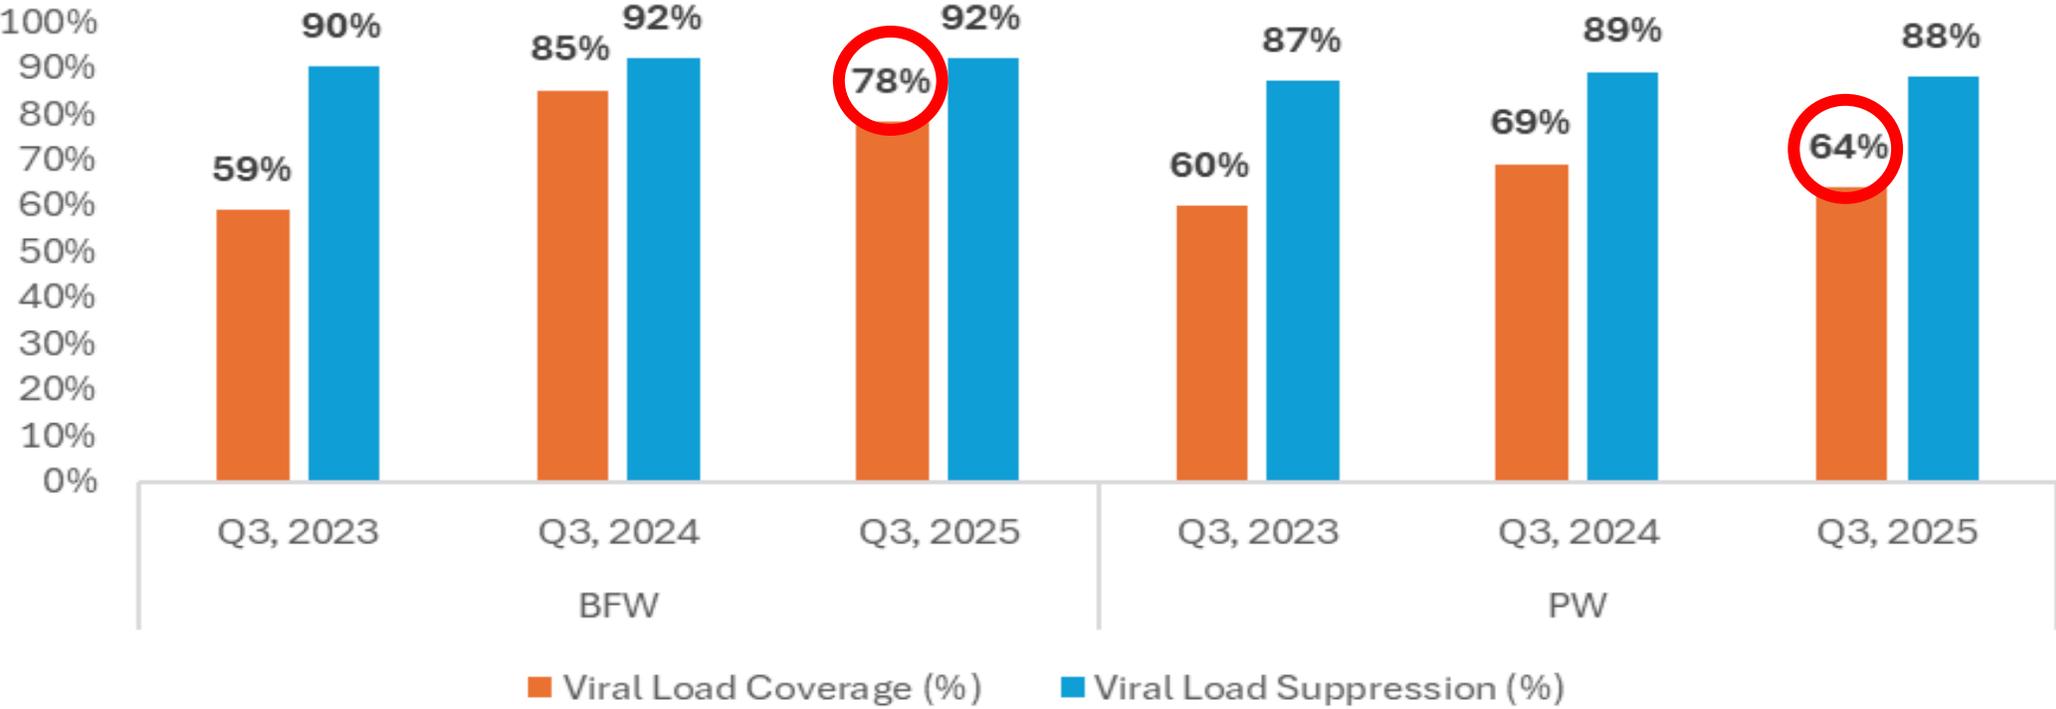

PW HIV+ enrolled in ANC are used as a proxy for the expected number of HIV-exposed children in the at-risk child clinic (CCR).

High HIV Testing Coverage and ART Uptake in ANC

- Integration of HIV prevention, testing and ART services at MCH
- Psychosocial support and peer support
- Mentorship, technical assistance, and monthly discussion of the VTP indicators with providers

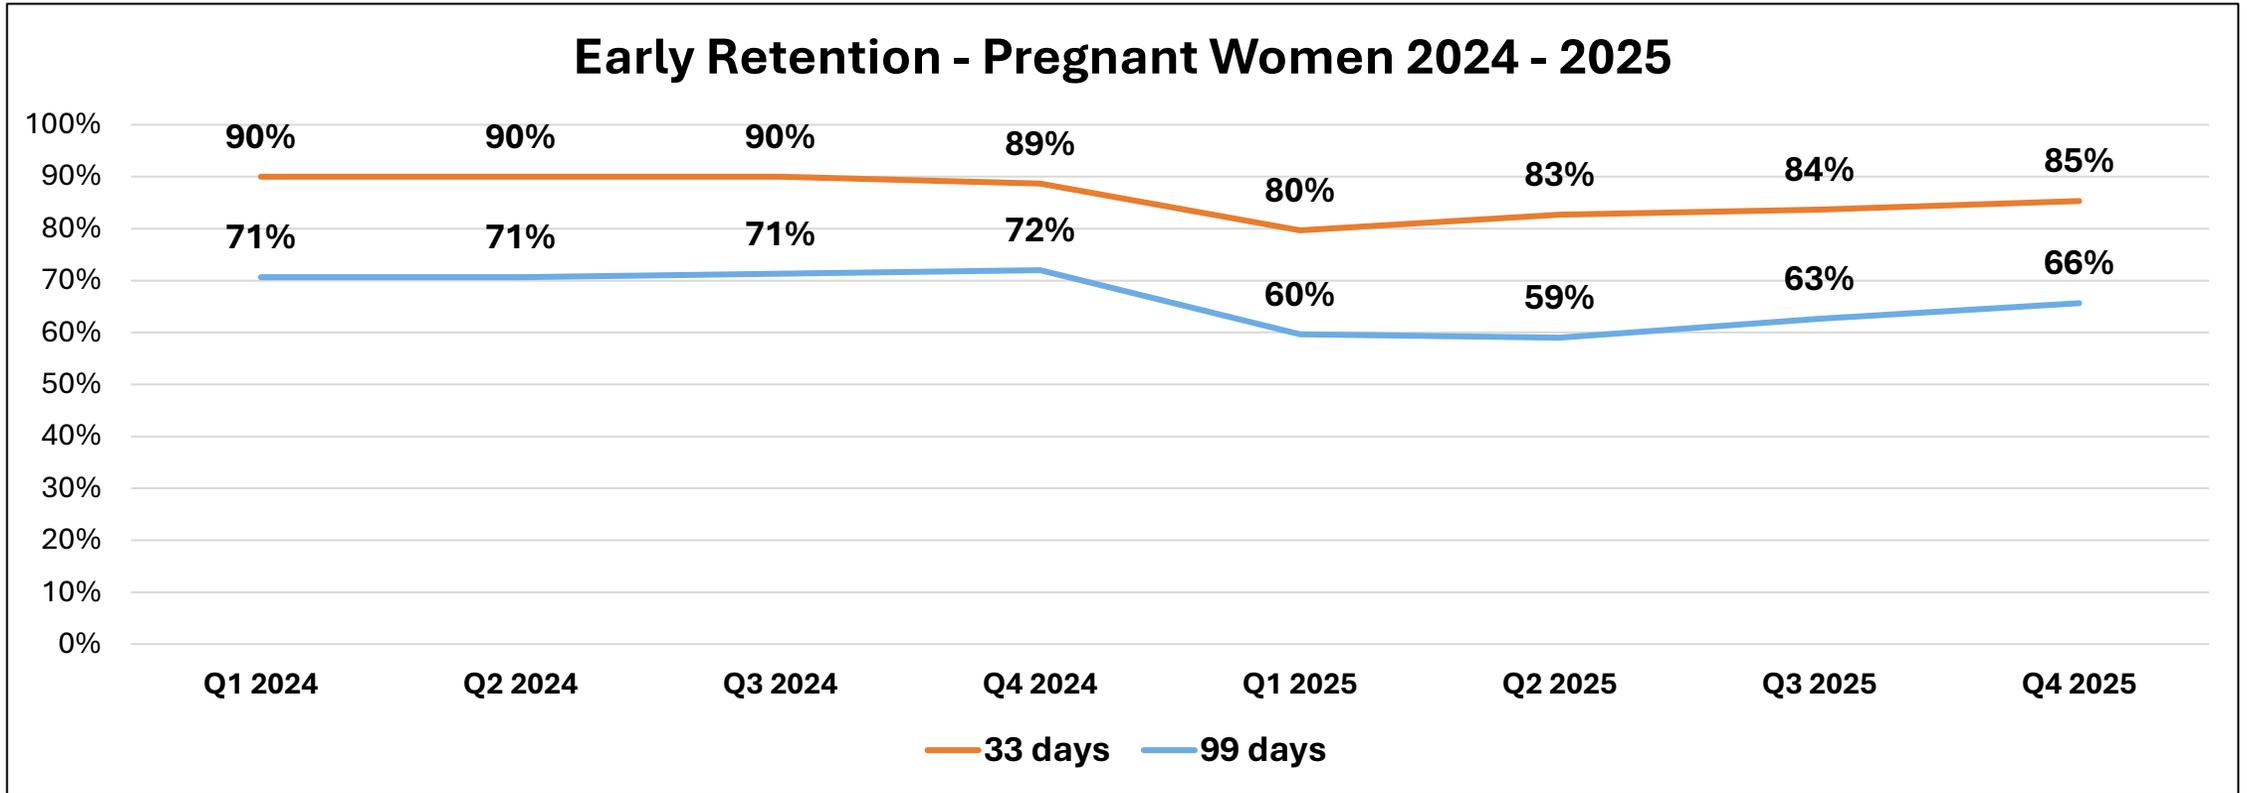

Missed Opportunities: Low Viral Load Coverage among PBFW

Viral Load Monitoring & Clinical Management Challenges

- Suboptimal viral load coverage and suppression
- Gaps in execution/fidelity of interventions for **PBFW with high viral load**
- Inadequate follow-up and clinical management of unsuppressed clients
- Stigma and non-disclosure

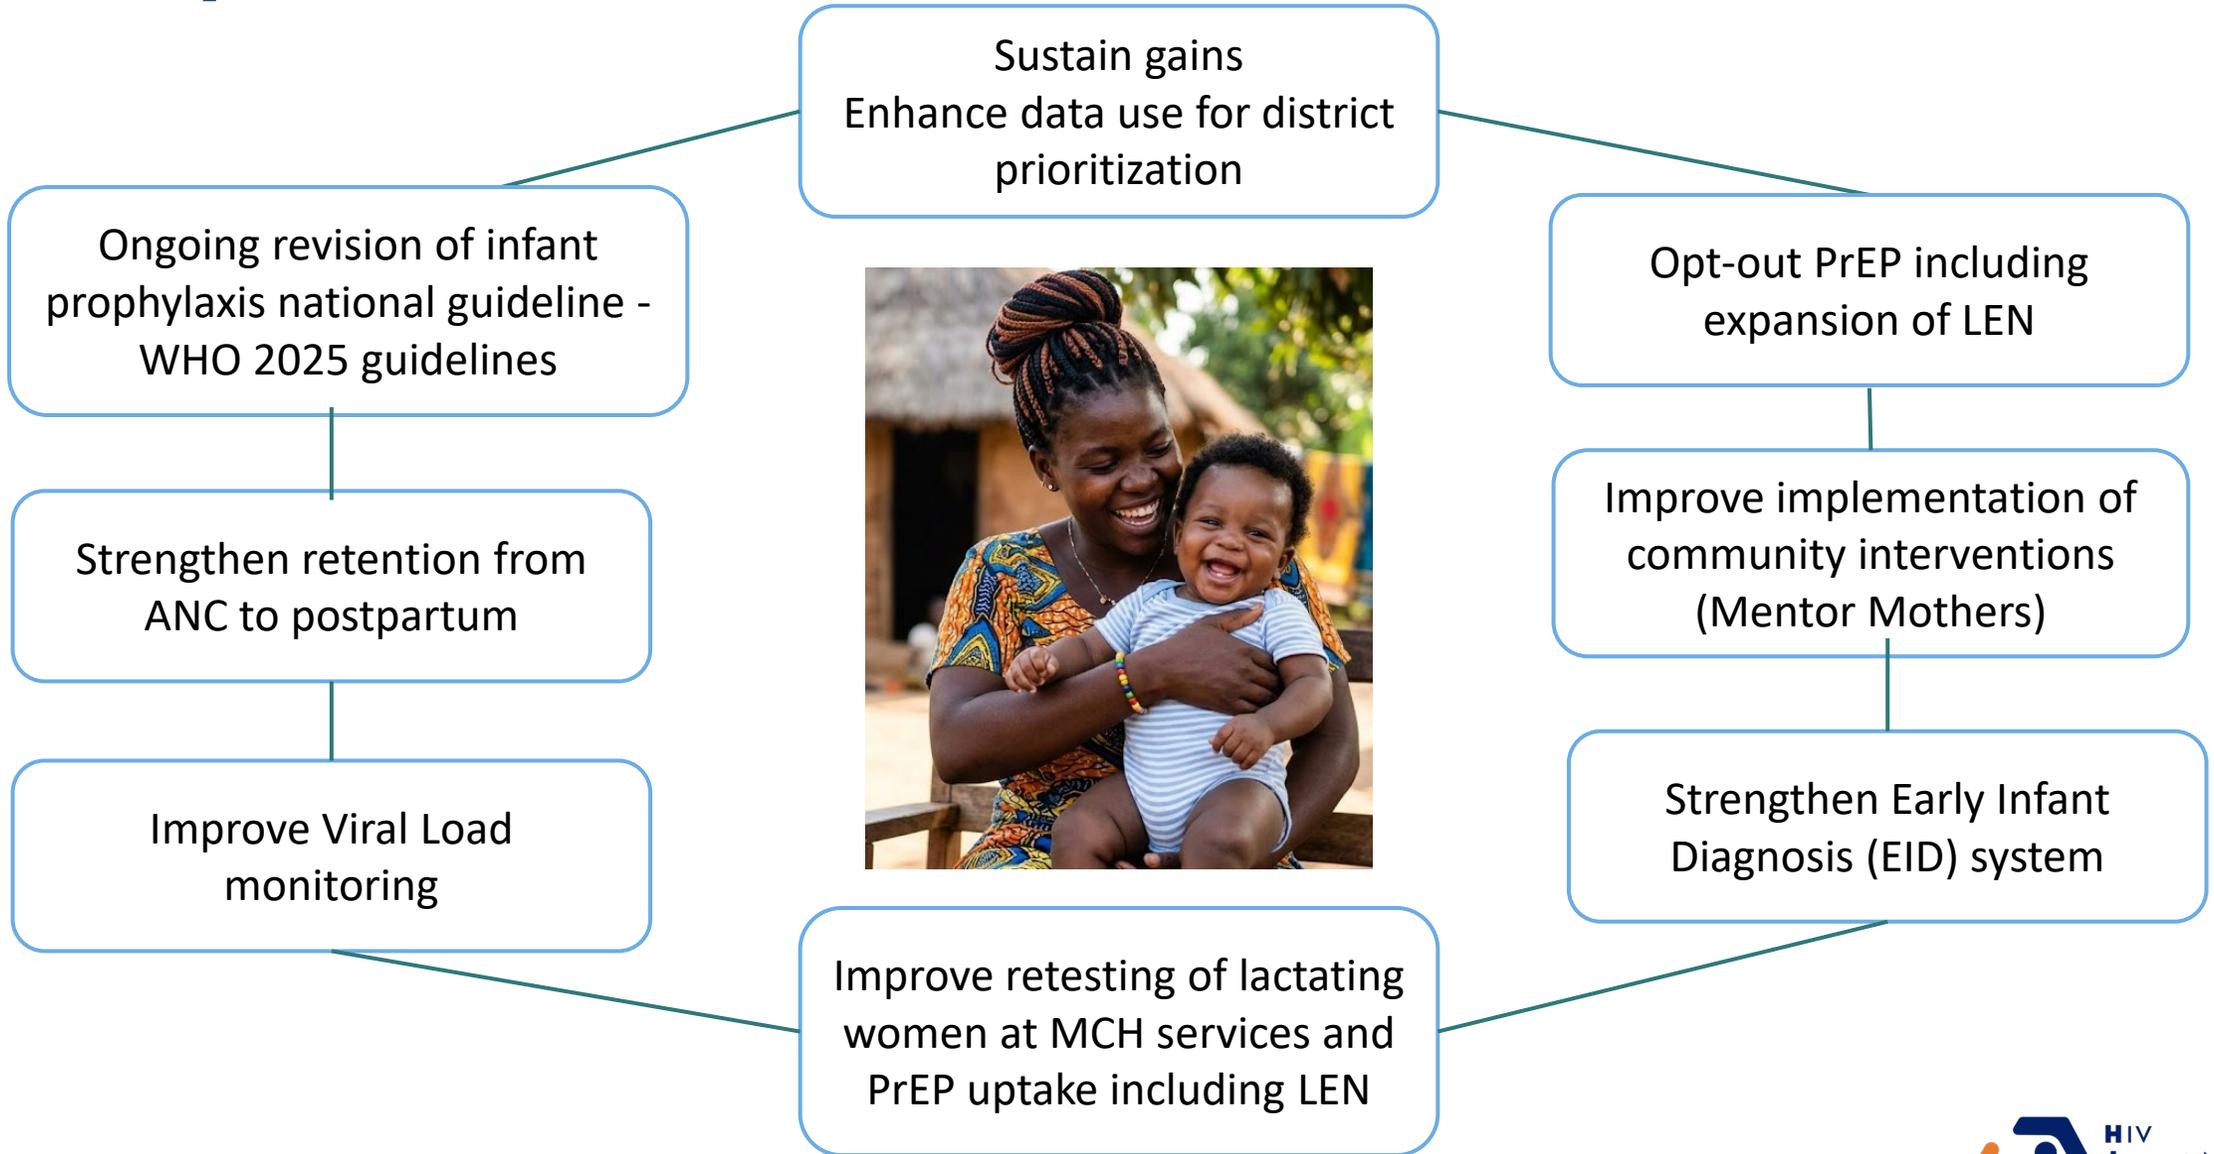

Gaps in Adherence at 33 and 99 days

Treatment & Retention (Maternal ART)

- Poor adherence to ART and clinical visits - increases in missed appointments in 2025
- Low coverage of Mentor Mothers, leading to high PBFW-to-Mentor Mother ratios
- Gaps in social support services
